

Implementation Work Order for an AI Coding Agent

Target: trenchfsafety.org · WordPress + WooCommerce + Elementor · Rev 2026-07-23

AGENT OPERATING RULES — read before any change

- **Never invent business facts.** This is a Merchant Center misrepresentation fix. Do not fabricate any name, address, phone, email, price, brand, or GTIN. If a required real value is not in Section B, STOP and ask the owner. A fake value gets the store banned.
- Back up first (database + files) before editing. Prefer a staging copy if one exists.
- Work the phases in order (C1→C7). After each phase, re-run the relevant verification in Section D.
- This is a rebuild, not a tweak. The site is a half-finished store on an unremoved theme demo; as-is Google would suspend it on sight. Do not submit to Merchant Center until Section D is all-green.

A · ACCESS & TOOLS THE AGENT NEEDS

- WordPress admin login or an Application Password (for the WP REST API).
- WooCommerce REST API consumer key/secret, Read/Write (WooCommerce → Settings → Advanced → REST API) — for bulk product edits.
- SSH / WP-CLI access if available (Hostinger supports it) — the fastest, safest way to search-replace demo strings across the database and manage plugins/pages.
- Note: much demo content lives in Elementor templates & theme options (serialized in the DB), which the WooCommerce API cannot reach. Use WP-CLI search-replace (serialization-safe) or the Elementor editor for those.

B · OWNER INPUTS REQUIRED (agent must obtain these first)

- ☐ One business identity — the real business/legal name to show everywhere (and whether “TrenchSafety” remains the brand although it sells containers/propane/trailers).
- ☐ Real contact — business email on the site’s own domain (not info@gmail.com), one real phone, one real street address (not a Plus Code), business hours.
- ☐ A real price for every product (the propane tanks are largely unpriced).
- ☐ Propane eligibility + shipping method (freight/LTL, lead times, restrictions).
- ☐ Payment processor legal name + checkout/statement descriptor (should read “TRENCHSAFETY”).

C · IMPLEMENTATION (execute in order)

C1 — Purge all theme-demo content (highest priority)

The demo header/footer + placeholder strings appear on every page. Fastest reliable method is a WP-CLI database search-replace (handles serialized Elementor data safely). Run one per real value, then clear caches:

```
wp search-replace 'info@gmail.com' 'sales@trenchsafety.org' --all-tables
wp search-replace '(+880)155-69566' '<REAL_PHONE>' --all-tables
wp search-replace '374 William S Canning Blvd, Fall River MA Road 2721, USA' '<REAL_ADDRESS>' --all-tables
wp search-replace 'VVV4+3G7, Watertown, SD 57201, USA' '<REAL_ADDRESS>' --all-tables
wp search-replace 'Yellow Construction Company' '<REAL_BUSINESS_NAME>' --all-tables
wp search-replace 'support.industrie@gmail.com' 'sales@trenchsafety.org' --all-tables
# remove the insurance placeholder tagline in the header/footer Elementor template via the editor
wp cache flush ; wp elementor flush-css 2>/dev/null || true
```

Then open Elementor → Templates → Theme Builder and fix the header/footer template's tagline ("...insurance needs") and any remaining demo text the search-replace didn't cover. Also set Settings → General (Site Title, Tagline, Admin email) and WooCommerce → Settings → General (store address) and → Emails (from-name/address) to the real business.

C2 — Delete demo pages & rebuild the menu

Trash all theme-demo pages (the "...Elements" demos, every /services/* page, Projects, Team, Pricing Plans, Appointment, the About/Contact duplicates, Coming-soon). Example via WP-CLI:

```
wp post list --post_type=page --fields=ID,post_title,post_name --format=table
# then, for each demo page id:
wp post delete <ID> --force
# rebuild the primary menu to real pages only:
# Home · Shop · Containers · Dump Trailers · Propane Tanks · Utility Trailers · About · Buyers Guide · Blog · Contact
```

Keep: homepage, /shop, the 4 product categories, one /about, /buyers-guide, /blog + posts, one /contact, all products, and the policy pages.

C3 — Disable "coming soon"

```
wp plugin deactivate ultimate-coming-soon
# confirm no page serves an under-construction wall to visitors or crawlers
```

C4 — One coherent identity (About + homepage)

Rewrite /about and the homepage hero to describe one real business that matches the domain/brand decision (Owner input B1). No demo text, no invented people. Update via WP REST:

```
curl -u USER:APP_PASSWORD -X POST https://trenchsafety.org/wp-json/wp/v2/pages/<ABOUT_ID> \
-H 'Content-Type: application/json' -d '{"content":"<real about html>"}'
```

C5 — Price & complete every product (WooCommerce REST API)

For every product set a real price, condition, brand, identifiers, and shipping weight/class. List then update:

```
GET /wp-json/wc/v3/products?per_page=100&page=N # enumerate all 269
PUT /wp-json/wc/v3/products/<id> {
  "regular_price": "<REAL_PRICE>", # never blank, never invented
  "weight": "<lbs>", "shipping_class": "freight",
  "brands": [ ... ], "sku": "<real>",
  "meta_data": [ {"key":"_gtin","value":"<real or empty>"},
    {"key":"condition","value":"new|used"} ] }
```

Ensure each product page is purchasable (add-to-cart → checkout) and price = feed = checkout. Publish drafts only after C1-C4 pass.

C6 — Verify & fix policy pages

Make shipping, refund/returns, product-condition, sales-tax, payment, terms and privacy real, specific, original and consistent (freight costs + lead times; return window/fees in real days; governing-law state; real business name/contact). Edit via WP REST /wp-json/wp/v2/pages/.

C7 — SEO & technical

- Set real page titles/meta in AIOSEO (replace “Home - trenchesafety.org” placeholder); regenerate the sitemap.
- Confirm HTTPS on every page incl. checkout; product images = real item, $\geq 500 \times 500$ px, no overlays.

D · VERIFICATION — must all pass before Merchant Center

1) Demo-string sweep — expect NO output:

```
for u in / /about /contact /shop /refund_returns /shipping-policy /terms-and-condition /privacy-policy-2
; do
  curl -s "https://trenchesafety.org$u" | grep -Eio \
    "insurance needs|yellow construction|\+880|fall river|william s canning|vvv4\+3g7|\
info@gmail\.com|support\.industrie|industrie|lorem|coming soon|joshua sendu" | sort -u | sed "s|^|$u: |"
done
```

2) Every product priced — expect count = 0:

```
GET /wp-json/wc/v3/products?per_page=100 → assert every item has a non-empty price
```

- Contact info identical across site, policies, Merchant Center, payment processor.
- Menu contains only real pages; coming-soon disabled; sitemap regenerated.
- Then: connect Google for WooCommerce on verified trenchesafety.org, match business info, request review ONCE.

Generated by the GMC Audit Bot skill from the trenchesafety.org audit + remediation brief. Internal compliance guidance — not legal advice or a guarantee of Merchant Center approval; propane / heavy-equipment categories get manual review.
